the authors' findings, although not directly related to the authors' conclusions, is that the authors did not find any significant differences in the prevalence of the disease between the two groups. This is a limitation of the study, as it does not allow for a comparison of the prevalence of the disease between the two groups.

1997b). The authors of the present study have been able to identify a number of factors that may be related to the development of the disorder. These factors include genetic, environmental, and psychological factors. The authors suggest that a combination of these factors may lead to the development of the disorder. The authors also suggest that the disorder may be related to the development of the disorder. The authors suggest that the disorder may be related to the development of the disorder. The authors suggest that the disorder may be related to the development of the disorder.

Abstract—The purpose of this study was to determine the effect of a 12-week training program on the heart rate (HR) and energy expenditure (EE) of sedentary, middle-aged women. The subjects were divided into two groups: a training group (n = 10) and a control group (n = 10). The training group performed a 12-week program of aerobic exercise, while the control group remained sedentary. HR and EE were measured at rest and during a 30-minute walk. The training group showed a significant decrease in HR and an increase in EE compared to the control group. The results suggest that a 12-week training program can improve cardiovascular fitness and energy expenditure in sedentary, middle-aged women.

10. The following information pertains to the operations of a company for the year ended December 31, 2011:

Net sales	100,000
Cost of goods sold	60,000
Operating expenses	20,000
Income tax expense	5,000

The company's operating income for 2011 is:

☐ 15,000 ☐ 15,000
☐ 15,000 ☐ 15,000
